Nondeterministic Finite Automata(NFA)

- 1. Definition
- 2. Notation
- 3. Construction
- 4. Language accepted by a NFA
- 5. Equivalence with DFA

 L_{x01} = {x 01 | x is any strings of 0's and 1's }

If $w \in L_{xO1}$, then

If $w \notin L_{xO1}$, then

2

 L_{x01} = {x 01 | x is any strings of 0's and 1's }

We start from the most simple string

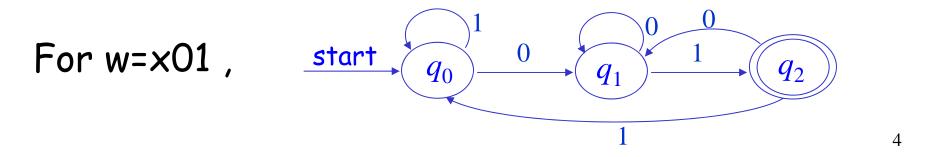

For w=01,
$$q_0 \longrightarrow q_1 \longrightarrow q_2$$

 L_{x01} = {x 01 | x is any strings of 0's and 1's }

Then to more complex strings

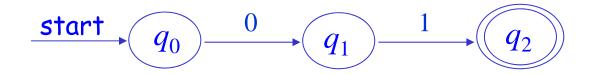

Finally to the most complex strings

 L_{x01} = {x 01 | x is any strings of 0's and 1's }

Let us look at the most simple

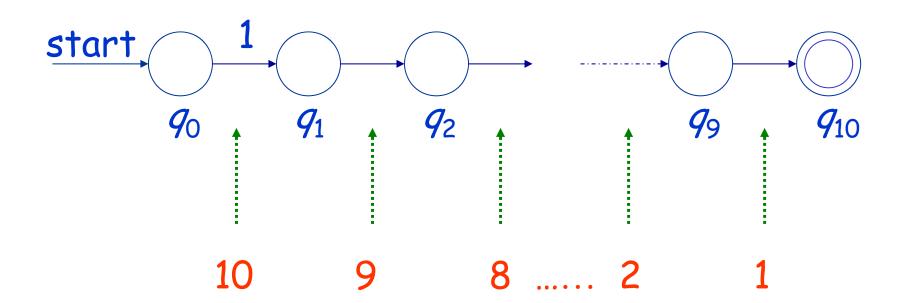

and most complex

Case for which DFA not suitable

 $L = \{w \mid w \text{ consists of 0's and 1's, and the }$ tenth symbol from the right end is 1 \}

Formal Definition of NFA

Nondeterministic finite automaton is a five-tuple,

such as
$$M = (Q, \Sigma, \delta, q_0, F)$$

Where Q is a finite set of states,

 Σ is a finite set of input symbols,

 q_0 is start state,

F is a set of final state,

 δ is transition function, which is a mapping

from $Q \times \Sigma$ to 2^Q .

 L_{x01} = {x 01 | x is any strings of 0's and 1's }

start
$$q_0$$
 q_1 q_2 q_2 q_3 q_4 q_5 q_6 q_6

Note
$$\delta : Q \times \Sigma \Rightarrow 2^Q$$

That
$$\delta(q, a) = \{q_1, q_2, ..., q_n\}$$

 L_{x01} = {x 01 | x is any strings of 0's and 1's }

$$N = (\{q_0, q_1, q_2\}, \{0, 1\}, \delta, q_0, \{q_2\})$$

 δ :

$$\delta(q_0, 0) = \{q_0, q_1\}, \quad \delta(q_0, 1) = \{q_1\},$$

$$\delta(q_1, 1) = \{q_2\}$$

Diagram and Table Notation

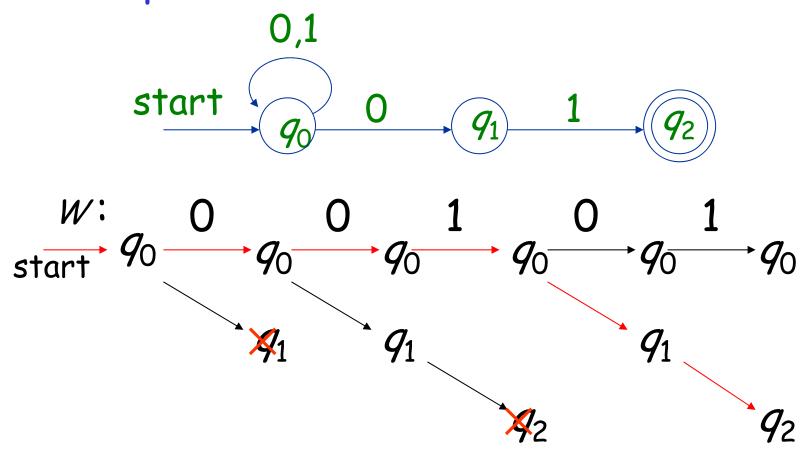

<u>Diagram</u>

Table

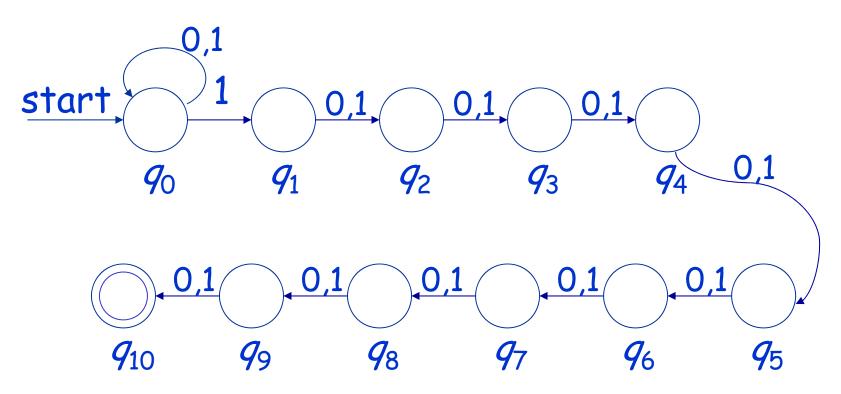

$$\begin{array}{c|cccc} & 0 & 1 \\ & \to q_0 & \{q_0, q_1\} & \{q_1\} \\ & q_1 & \{\} & \{q_2\} \\ & \star q_2 & \{\} & \{\} \end{array}$$

Description

There is a path, labeled with a sequence of symbols one by one, from start state to final state.

 $L = \{w \mid w \text{ consists of 0's and 1's, and the }$ tenth symbol from the right end is 1 \}

Extending transition function to string

BASIS

$$\hat{\delta}(q,\varepsilon) = q.$$

INDUCTION

Surpose
$$w = xa$$
, $\hat{\delta}(q, x) = \{p_1, p_2, \dots, p_k\}$

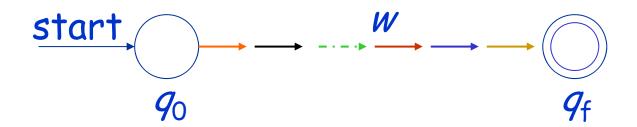

Let
$$\bigcup_{i=1}^{k} \delta(p_i, a) = \{r_1, r_2, \dots, r_m\}$$

Then
$$\hat{\mathcal{S}}(q, w) = \{r_1, r_2, \dots, r_m\}$$

The language of NFA

Definition The language of an NFA A is denoted L(A), and defined by

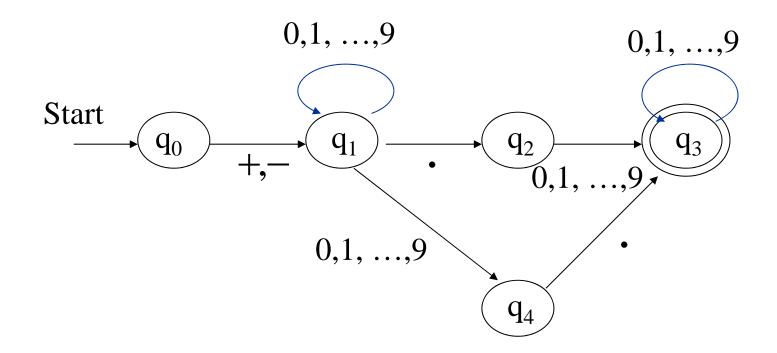

$$L(A) = \{ w \mid \hat{\mathcal{S}}(q_0, w) \cap F \neq \emptyset \}$$

There is at least a path, labeled with w, from start state to final state.

An Exercise

Describe the language accepted by this NFA:

What about the NFA just accept the float numbers?

Good good study day up.
